

Home

Welcome to **Daisy** - the open source content management application framework.

Daisy was released on October 12th during the Cocoon GetTogether.

Daisy is a comprehensive content management application framework, consisting of a standalone repository server accessible through HTTP/XML and a high-level (remote) Java API, and an extensive Daisy browsing and editing DaisyWiki application. Daisy is licensed under the commercially-friendly Apache License 2.0.

Daisy is used to host its own documentation: browse around and learn all there is to know about using and developing with Daisy.
