

What's causing the error "Could not find component (key [daisy-repository-manager])"?

When browsing to the Daisy Wiki, you see the following error:

```
Initialization Problem
Message: null
Description: No details available.
Sender: org.apache.cocoon.servlet.CocoonServlet
Source: Cocoon Servlet
cause
Could not find component (key [daisy-repository-manager])
request-uri
/daisy/<something>
```

This error occurs when the initialisation of the "daisy-repository-manager" component fails, and the most likely cause of this is that it cannot connect to the Daisy repository server (full details can always be found in the log file: <wikidata dir>/logs/cocoon.log).

Possible reasons why the Wiki can't connect to the repository server:

- the repository server is not running. Solution: start it, and also restart the Daisy Wiki.
- the repository server is running, but the Daisy Wiki was started too soon after it, when the repository was not yet fully started (takes at most a few seconds). Solution: restart the Daisy Wiki.
