

Trying to run [some script] I get the error "DAISY_HOME not set!".

When running scripts/tools such as daisy-wiki-add-site, daisy-import/export, etc. it is required to first set the DAISY_HOME environment variable. This variable should point to the root of the Daisy installation, for example:

```
[Windows]
set DAISY_HOME=c:\daisy-2.0

[Linux]
export DAISY_HOME=/home/daisy_user/daisy-2.0
```
